

Your Document Title

by

Author

A dissertation submitted in partial fulfilment
of the requirements for the degree of

[Your Degree, e.g. MEng / MSc / PhD]

Supervisor: Dr A. Supervisor
Department: Department of [Your Department]

University of [Your University]

May 2026

Declaration of Authorship

I, Author, declare that this dissertation, titled “Your Document Title”, and the work presented in it are my own. I confirm that:

- This work was done wholly while in candidature for a degree at University of [Your University].
- Where any part of this dissertation has previously been submitted for a degree or any other qualification at this or any other institution, this has been clearly stated.
- Where I have consulted the published work of others, this is always clearly attributed.
- Where I have quoted from the work of others, the source is always given. With the exception of such quotations, this dissertation is entirely my own work.
- I have acknowledged all main sources of help.
- Where the dissertation is based on work done by myself jointly with others, I have made clear exactly what was done by others and what I have contributed myself.

1 Template Overview

THIS LaTeX template is intended for clear, consistent technical documentation across a wide range of disciplines — engineering reports, research write-ups, specifications, educational material, and university dissertations among them. It provides a structured framework for presenting figures, calculations, code, and supporting explanation in a way that is easy to read and review, and comes with a selection of commonly used LaTeX packages pre-configured. The examples below happen to use an electronics worked example, but nothing in the framework is specific to any one field; swap the example content for your own.

1.1 Package Examples

1.1.1 Mathematics with SI Units

As an example, consider the emitter resistor from a simple bias network. With an emitter voltage of 1.65 V and an emitter resistor of 330 Ω, the emitter current is

$$I_{\mathrm{E}} = \frac{V_{\mathrm{E}}}{R_{\mathrm{E}}} = \frac{1.65\,\mathrm{V}}{330\,\Omega} \approx 5.0\,\mathrm{mA}. \tag{1}$$

Using this current, the power dissipated in the resistor can be estimated as

$$P_{R_{\mathrm{E}}} = I_{\mathrm{E}}^{2} R_{\mathrm{E}} \approx \left(5.0\,\mathrm{mA}\right)^{2} \cdot 330\,\Omega \approx 8.3\,\mathrm{mW}. \tag{2}$$

Here, `siunitx` is used to keep all numerical values and units formatted consistently via `\qty{...}{...}` and `\unit{...}`, while `mathtools` and `amsmath` provide the aligned equations.

1.1.2 Code Listings

Source code can be included directly from external files using the `listings` package (or `minted`, which is available as an optional extra). For example:

```c
#include <stdio.h>

int main() {
   printf("Hello, World!"); /*printf() outputs the quoted string*/
   return 0;
}
```

Listing 1: Code Example

1.1.3 Cross-Referencing

The template uses `varioref` and `cleveref` to provide flexible cross-references. Headings, equations, figures and tables can be labelled once and then referred to consistently throughout the document.

For example, the general overview for this template is explained in section 1 on the preceding page. If that section moves to a different page during editing, the reference text is updated automatically to reflect the new location (for example, “section 1.2 on page 3” or “section 1.2 on the previous page”).

1.1.4 Plots

This figure shows a simple time-domain plot created directly in LaTeX using the `pgfplots` package.

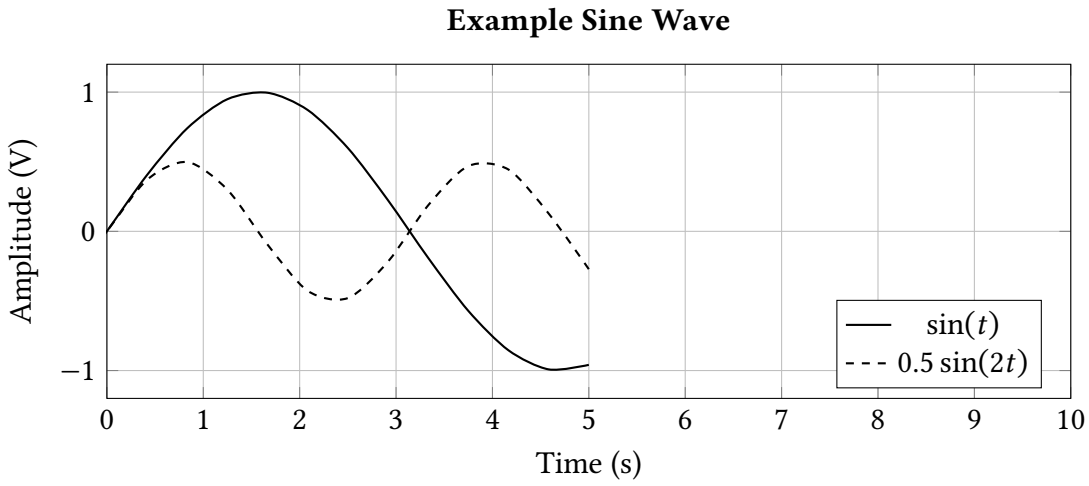

Figure 1: Example plot generated directly in LaTeX using `pgfplots`.

1.1.5 Timing Diagrams

Figure 2 on the next page shows an example digital timing diagram created directly in LaTeX using the `tikz-timing` package. The diagram includes a free-running clock, an active-low reset pulse, a data signal, and a VALID strobe indicating when the data should be sampled.

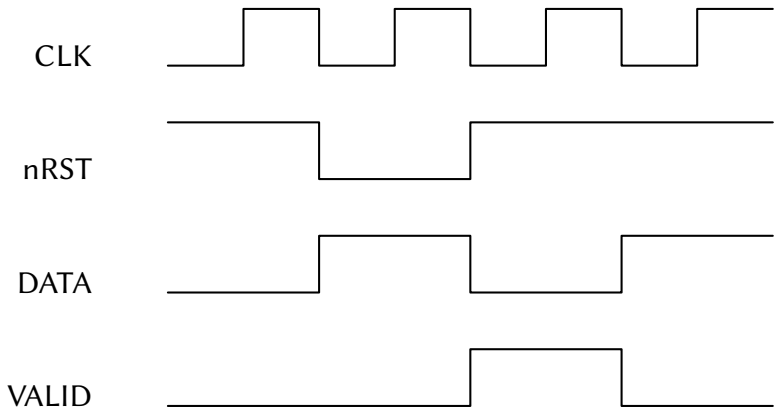

Figure 2: Example timing diagram generated with `tikz-timing`.

1.1.6 Citations and Bibliography

The optical transmission of ceramics can be estimated using simplified scattering models; this is described in "A new closed-form expression is presented for estimating the real-in-line transmission of ceramics consisting of non-absorbing phases in dependence of the inclusion or pore size" [1]. This section demonstrates how to cite a source, in IEEE format, in text and automatically generate a bibliography.

References

[1] W. Pabst and J. Hostaša, "A closed-form expression approximating the Mie solution for the real-in-line transmission of ceramics with spherical inclusions or pores," Department of Glass and Ceramics, Institute of Chemical Technology, Prague, 2013, example reference used in the Technical Document Template.

A Example Appendix Content

This appendix provides a simple example of how appendices can be added to documents created with this template. In a real project, this section might contain supporting material such as:

- Detailed calculations or derivations that would clutter the main text.
- Additional plots, figures, or tables used for internal analysis.
- Supporting code snippets, test procedures, or measurement logs.

You can add further sections or subsections here as needed, following the same structure as the main sections.
